The Model

- ▶ Time is discrete and indexed by $t \in \{0, 1, 2, ..\}$
- There is no growth in technology and population size

Households

- lacktriangle Agents live for T periods and retire in period T_R
- ▶ Household age is discrete and indexed by $j \in \{1, 2, ..., T\}$
- Save in bonds and supply labor exogenously

Variables

- **1.** Consumption: $c_{j,t}$ (endogenous)
- **2.** Saving (in bonds): $a_{j,t}$ (endogenous)
- **3.** Labour supply: $I_{j,t}$ (exogenous)

Exogenous Prices (partial equilibirum)

- **1.** Wage: $w_t = w$
- **2.** Interest rate (on bonds): $r_t = r$
- \Rightarrow amounts to assuming a small open economy taking prices as given

The Household Problem

Agent i born at time t, who starts to consume in period t+1, faces the following problem:

$$\max_{\{c_{i}^{i}, a_{t}^{i}\}} U = \sum_{j=1}^{T} \beta^{t} u(c_{j,t}^{i})$$

$$s.t.$$

$$c_{j,t}^{i} + a_{j,t}^{i} = w_{t+j} I_{j,t} + (1 + r_{t+j}) a_{j-1,t}^{i}$$
(1)

with
$$I_{j,t} = \begin{cases} 1 & \text{if } j \leq T_r \\ 0 & \text{otherwise} \end{cases}$$
 (2)

and
$$a_{0,t} \sim \mathsf{Lognormal}\left(\mu, \sigma^2\right)$$

(3)

See Log-normal Distribution!

Constant Relative Risk Aversion (CRRA) Utility

$$u(c) = \begin{cases} \frac{c^{1-\rho} - 1}{1-\rho} & \rho \ge 0, \rho \ne 1\\ \log(c) & \rho = 1, \end{cases}$$
 (4)

where intertemporal elasticity of substitution (IES) of consumption is define by

$$IES \equiv rac{d\left(rac{c_{j+1,t+1}}{c_{j,t}}
ight)}{d(1+r)}\cdotrac{1+r}{rac{c_{j+1,t+1}}{c_{j,t}}}=rac{1}{
ho},$$

which is non-separable from the relative risk aversion (RRA)

$$RRA \equiv -c \cdot \frac{u''(c)}{u'(c)} = \rho.$$

Use Epstein-Zin Preferences if you want to separate the two!

First Order Condition (FOC) and Consolidated Budget

Derive the period-by-period Euler-Equation:

$$c_{j+1,t}^{i} = c_{j,t}^{i} \left[\beta \left(1 + r_{t+j+1} \right) \right]^{\frac{1}{\rho}}$$
 (5)

Derive the long-term Euler-Equation by iterating the period-by-period Euler-Equation forward:

$$c_{j,t}^{i} = c_{1,t}^{i} \left[\beta^{j-1} \prod_{x=2}^{j} (1 + r_{t+x}) \right]^{\frac{1}{\rho}} \quad \text{for } j > 1$$
 (6)

Derive the consolidated budget constraint at birth:

$$\underbrace{\sum_{j=1}^{T} \frac{c_{j,t}^{i}}{\prod_{x=1}^{j} (1+r_{t+x})}}_{\text{NPV of consumption}} = \underbrace{\sum_{j=1}^{T} \frac{w_{t+j}l_{j,t}}{\prod_{x=1}^{j} (1+r_{t+x})}}_{\text{NPV of labor income}} + \underbrace{\frac{a_{0,t}^{i}}{1+r_{t+1}}}_{\text{Initial wealth}}$$

Closed-form Solution (1)

Use the consolidated budget constraint to solve for $c_{1,t}^i$ by eliminating $c_{j,t}^i$ using the long-term Euler-Equation:

$$c_{1,t}^{j,*} = \frac{\sum_{j=1}^{T} \frac{w_{t+j}l_{j,t}}{\prod_{x=1}^{j} (1+r_{t+x})} + \frac{a'_{0,t}}{1+r_{t+1}}}{\sum_{j=1}^{T} \frac{\left[\frac{\beta^{j-1}}{(1+r_{t+1})} \prod_{x=1}^{j} (1+r_{t+x})\right]^{\frac{1}{\rho}}}{\prod_{x=1}^{j} (1+r_{t+x})}}.$$
(7)

Insert the solution in (8) into the long-term Euler-Equation (6) to solve for $c_{j,t}^{i,*}$ for j>1:

$$c_{j,t}^{i,*} = c_{1,t}^{i,*} \left[\beta^{j-1} \prod_{x=2}^{j} (1 + r_{t+x}) \right]^{\frac{1}{\hat{
ho}}} \quad \text{for } j > 1$$

Closed-form Solution (2)

Since $r_t = r$ and $w_t = w$ holds, the solution simplifies to

$$c_{1,t}^{i,*} = \frac{w \sum_{j=1}^{T} \frac{l_{j,t}}{(1+r)^{j}} + \frac{a'_{0,t}}{1+r}}{\sum_{j=1}^{T} \frac{\left[\beta (1+r)\right]^{\frac{j-1}{\rho}}}{(1+r)^{j}}} = \frac{X+Y^{i}}{Z}$$
(8)

with

$$X \equiv w \sum_{j=1}^{T} \frac{I_{j,t}}{(1+r)^{j}} \quad Y^{i} \equiv \frac{a_{0,t}^{i}}{1+r} \quad Z = \sum_{j=1}^{T} \frac{\left[\beta (1+r)\right]^{\frac{j-p}{p}}}{(1+r)^{j}}$$
(9)

Using the Long-run Euler, we can solve for

$$c_{i,t}^{i,*} = c_{1,t}^{i,*} \left[\beta \left(1 + r \right) \right]^{\frac{j-1}{\rho}} \quad \text{for } j > 1$$
 (10)

Closed-form Solution (3)

Insert the solution for consumption $c_{j,t}^*$ into the budget constraint (1) to back out the solution for savings:

$$a_{j,t}^* = w_{t+j}I_{j,t} + (1+r_{t+j})a_{j-1,t} - c_{j,t}^*$$
(11)

⇒ final steps are calibration and simulation

Calibration

Parameter	Description	Value	Origin
Timing T T _R	Maximum age of life Retirement Age	20 15	Model period $pprox$ 4 years
Prices r w	Interest rate Wage	0.13	To match an annual int. rate of 3% Normalization
Preference. eta	s Subj. discount factor RRA / Inverse IES	0.96 2.0	To match annual factor of 0.99 Standard value
Distributio $\mu \ \sigma$	n Location Scale	0 1	

Result

Simulated Consumption and Savings
